To Whom It May Concern:

This letter is in regard to Mrs. Bonnie Kellerby whom I saw in Sacramento California. On June 26th, 2011 at 1413 Howe Avenue, a meeting was held with approximately 30 attendees. The purpose of the meeting was to provide Radio Frequency Scanning on a larger spectrum of victims with similar type complaints of signs and symptoms. Bonnie Kellerby contacted me regarding the possible micro chipping of her person after hearing of my involvement in helping victims in similar cases. I have worked closely with Dr. John Hall a leading expert in this field and the author of "A New Breed Satellite Terrorism in America" Most recently a gentleman from Missouri; James Walbert had an MRI taken of his cervical spine and shoulders in which Dr. Hall was asked to evaluate. Prior to the MRI he had been evaluated by The William Taylor Investigative Agency. His evaluation included frequency scanning, which turned up positive radio transmissions emitting from his right posterior trapezius muscle. Indeed, a foreign body was found to be present on MRI of the right trapezius muscle. According to Dr. Hall the object resembles a "verichip" style implant.

Due to the exponential rise of people voicing complaints of covert chipping and electronic terrorism, I purchased the same equipment used by the above-mentioned agency to scan individuals voicing these complaints. It is my opinion, and the opinion of other professionals involved with this phenomenon that we may be dealing with a form of non-consensual experimentation or criminal access to otherwise government controlled technology. Nonetheless, Mrs. Kellerby was scanned with a JM-20 Pro and Aceco F1003 frequency scanning unit. The JM-20 Pro is a general scanner that alerts to a transmission after adjusting it to any surrounding artifact. The Aceco actually gives a digital read out of the detected frequency found to be emitting. Mrs. Kellerby had a positive scan along the left TMJ joint and a positive frequency counter scan. The numerical values that Mrs. Kellerby's scan came up with suggest that this frequency is consistent with frequencies associated with RFID operational spectrums.

It is my recommendation that Mrs. Kellerby obtain further studies. Those studies should be in the form of a high digital panoramic x-ray, MRI Scan or CT scan. Ultimately a scan in a faraday cage would be appropriate to further isolate any RF transmission from her person. Mrs. Kellerby's symptoms along with a positive frequency scan certainly suggest the possibility of covert, non-consensual chipping.

Respectfully,

Jesse Beltran
